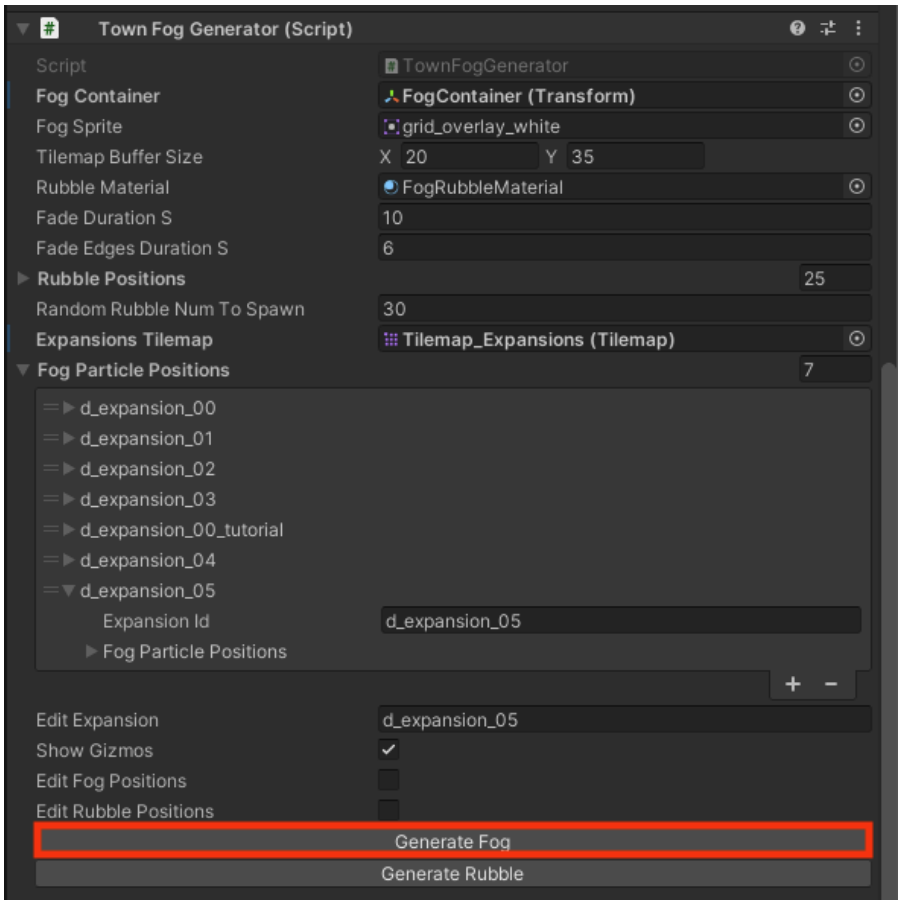
Terrain 2.0 Notes and Best Practices

Tilemap

- Expansion tiles in the tilemap define the fog boundaries. For expansions along the edge of the map you should extend the tiles to cover any art you want players to see. Use “unplayable” tiles on Custom Tilemap to block the unplayable but visible areas

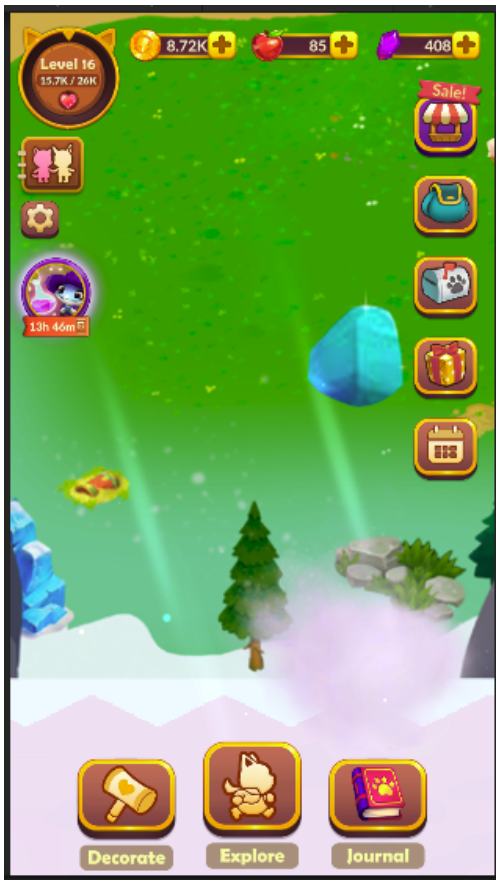
Fog bounds covering art along terrain bounds

- Use “Generate Fog” button on Tilemap_Fog in the Town scene once expansions are finalized. Do this for each expansion (set the “Edit Expansion” field to change target expansion) and sanity the generated positions (gizmos will be drawn in the scene). You can also run Generate Rubble to randomly place trees around the fog (per expansion)



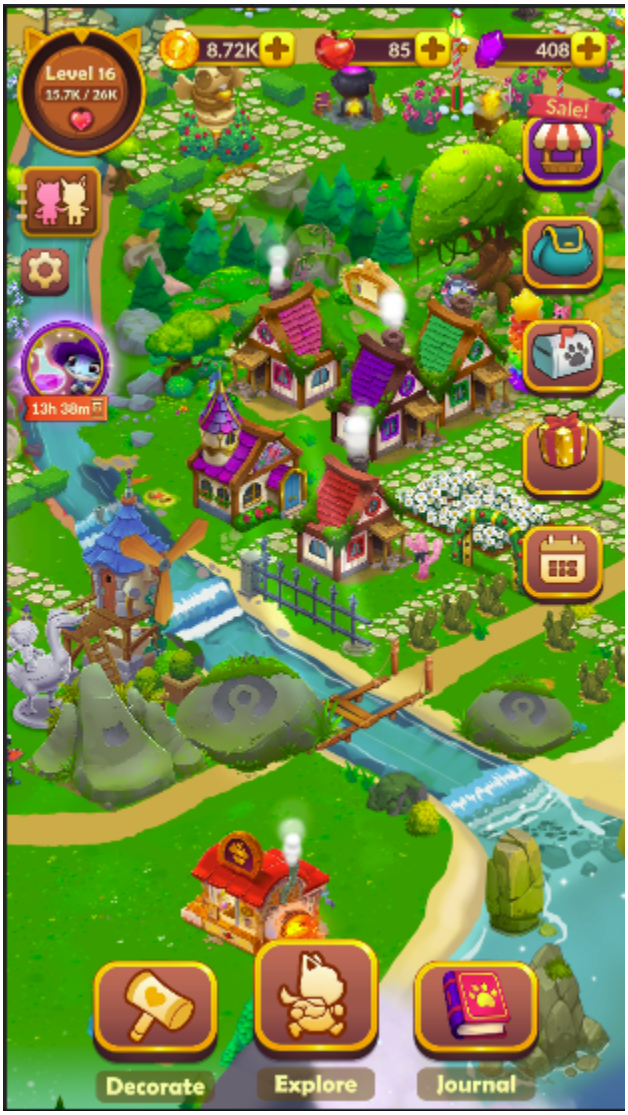
Terrain

- (For Lucy) Everything interactable, animated, or with height needs to be broken out into separate pieces on the terrain art. This includes placeholder rubble, waystones, baked in trees/rocks, and the art along the borders of town



Buried chest, jelly rock, and border trees need to be broken out into separate assets

- Misc Note: These Mossy Boulders are static buildables in my saved town (from prod) and need to be moved in the new starting town or cleaned up with a patcher. They make great placeholder assets though if we want to reserve any more space in town.



Rubble

- New Rubble can be added to the Clearables excel sheet. For multi-stage rubble define one proto id per stage and use “Next Proto Id” to define the rubble id to replace the rubble being cleared (similar to upgrades). Use the Grants tab to grant rewards for clearing the rubble (this can be a loot table)
- I’ve added a patcher for migrating rubble in d_town_clearables_patch_v10, where you can specify the previous and new rubble counts, and it will try to remove/add rubble as needed to hit a target value. You can also add the new large rubble to safe coordinates here (don’t worry about the instance id)
